

CONVEYOR AND SORTATION SYSTEM OR MOBILE AUTOMATION - WHY NOT BOTH?

Labor continues to be a struggle, so automated solutions are quickly becoming necessary. Instead of choosing one or the other, operators can use a combination of conveyors and sortation systems with AGVs and AMRs to make everything run smoothly.

CUSTOMIZED SYSTEMS ARE MOST BENEFICIAL

Often determined by:

VOLUME

The amount of product that moves through facility

RATE

How fast everything moves through the facility

PRODUCT

Eaches and pallets, boxes and poly bags all require different handling

THE RIGHT MIX OF TECHNOLOGY CAN:

-  **Improve safety** - distancing people from the need to lift or move goods repetitively
-  **Improve throughput** - faster unloading can mean a later cutoff time, making you able to dispatch faster

CONVEYOR AND SORTATION ARE IDEAL FOR:

- Moving goods quickly along a fixed path
- Regular and high volume operation
- Sorting goods into different areas of warehouse [i.e storage or shipping]

SIGNS TO LOOK FOR IN A PARTNER

EXPERIENCE Have they done a similar system in the past?

QUESTIONS Are they asking you questions about your process, products, facility, everything?

MAINTENANCE Do they have training available for your employees or do they offer a maintenance package?

AGVs & AMRs ARE IDEAL FOR:

- Application typically done by people on lift trucks
- Reducing repetitive motion for employees
- Moving goods without changing the layout
